2.2 No response for a long time for the installation of the docker.....	8
2.3 Fail to pull image	9
2.4 NDI Core could not be logged in normally	10
2.5 How to set static IP address for NDI Core.....	11

Note

To deploy the NDI Core, you need to load the NDI Core mirror locally. Please contact the sales staff at Kiloview or send an email to info@kiloview.com to obtain the mirror.

1 Kiloview NDI Core server deployment

1.1 Server environment preparation

1.1.1 Hardware environment

Processor: High frequency CPU, such as E2288G, 12 Generation Core i5 12600K.

Hard disk: 64G or higher.

Memory: 4GB RAM or above 16G.

Network card: one or more 10G or higher speed network card.

1.1.2 Software environment

Operation system: Linux64-bit operating system (Ubuntu 18.04, 20.04) .

1.1.3 Network environment

Internet application tools and image files.

LAN Bandwidth: 10 Gigabit networks.

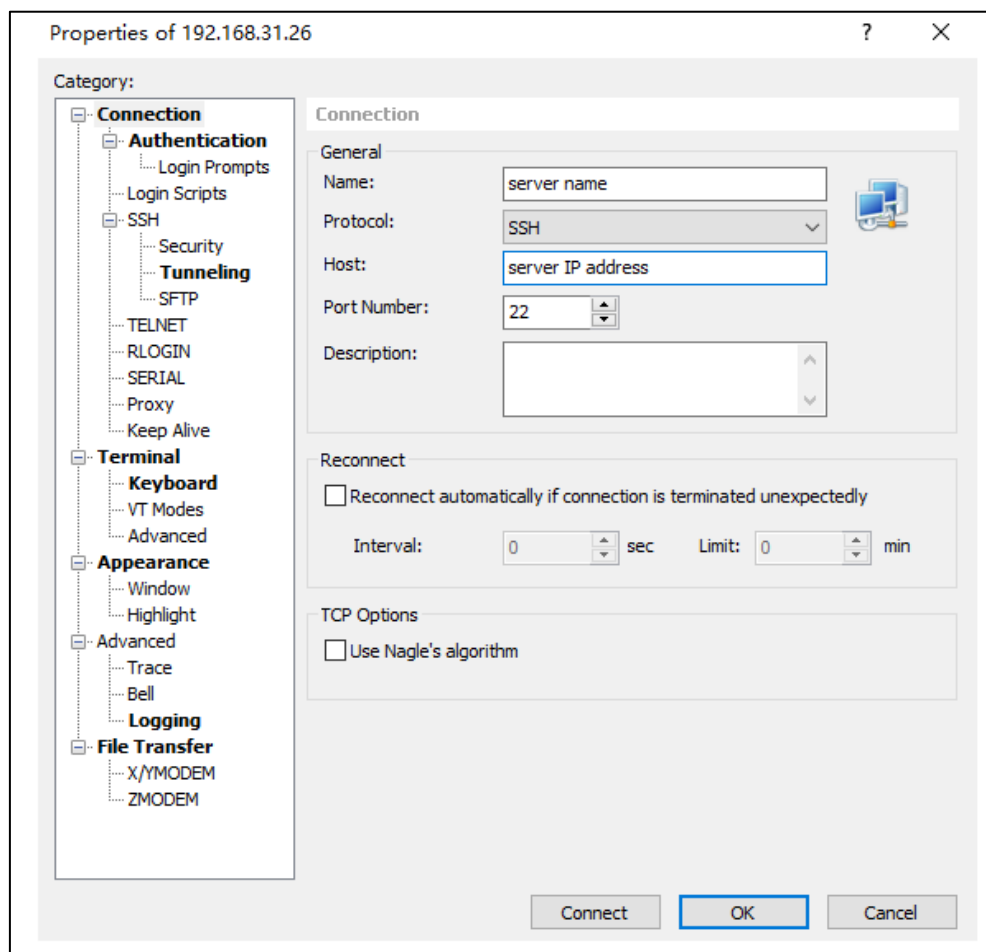

1.2 Login to server

You can use remote terminal software to login to the server, Xshell or PuTTY is recommended.

Xshell download website: <https://www.netsarang.com/zh/xshell-download/>

PuTTY download website: <https://www.chiark.greenend.org.uk/~sgtatham/putty/latest.html>

- 1) After installing Xshell, enter IP address of the server in the new session and use SSH protocol to communicate. The default port is 22, click "Ok" after input completed.

2) Enter the user name and password in the pop-up dialog box. Ordinary users need sudo to obtain management right or log in as root user. The deployment process in the following is completed by root user.

You can enter "sudo su- " in command window to switch to the root user.

1.3 Deployment guide

Step 1: Install container. Enter "curl -fsSL https://get.docker.com | bash" in the terminal window.

```
root@kiloview:/# curl -fsSL https://get.docker.com | sh
# Executing docker install script, commit: 93d2499759296ac1f9c510605fef85052a2c32be

+ sh -c apt-get update -qq >/dev/null
+ sh -c DEBIAN_FRONTEND=noninteractive apt-get install -y -qq apt-transport-https ca-certificates curl >/dev/null
+ sh -c curl -fsSL "https://download.docker.com/linux/ubuntu/gpg" | gpg --dearmor --yes -o /usr/share/keyrings/docker-archive-keyring.gpg
+ sh -c echo "deb [arch=amd64 signed-by=/usr/share/keyrings/docker-archive-keyring.gpg] https://download.docker.com/linux/ubuntu focal stable" > /etc/apt/sources.list.d/docker.list
+ sh -c apt-get update -qq >/dev/null
+ sh -c DEBIAN_FRONTEND=noninteractive apt-get install -y -qq --no-install-recommends docker-ce-cli docker-scan-plugin docker-ce >/dev/null
+ version_gte 20.10
+ [ -z ]
+ return 0
+ sh -c DEBIAN_FRONTEND=noninteractive apt-get install -y -qq docker-ce-rootless-extras >/dev/null
+ sh -c docker version

Use 'apt autoremove' to remove them.
The following additional packages will be installed:
  libavahi-core7 libdaemon0 libss-mDNS
Suggested packages:
  avahi-autoipd avahi-autoipd | zeroconf
The following NEW packages will be installed:
  avahi-daemon libavahi-core7 libdaemon0 libss-mDNS
0 upgraded, 4 newly installed, 0 to remove and 43 not upgraded.
Need to get 189 kB of archives.
After this operation, 765 kB of additional disk space will be used.
Do you want to continue? [Y/n] y

```

Enter Y behind “Do you want to continue?[Y/n]” . Waiting for the installation completed.

Step 3: Install netdata to obtain CPU, network datasheet, etc. Enter

“docker run -d --name status --restart=always -v /var/run/docker.sock:/var/run/docker.sock:ro --pid host --network host -e GLANCES_OPT="-w" nicolargo/glances” in the terminal window.

```

root@VM-0-9-ubuntu:~# docker run -d --name status --restart=always -v /var/run/docker.sock:/var/run/docker.sock:ro --pid host --network host -e GLANCES_OPT="-w" nicolargo/glances
Unable to find image 'nicolargo/glances:latest' locally

root@VM-0-9-ubuntu:~#

```

Step 4: Upload NDI Core image to the server

(1) Upload NDI Core image from personal computer to server.

Note

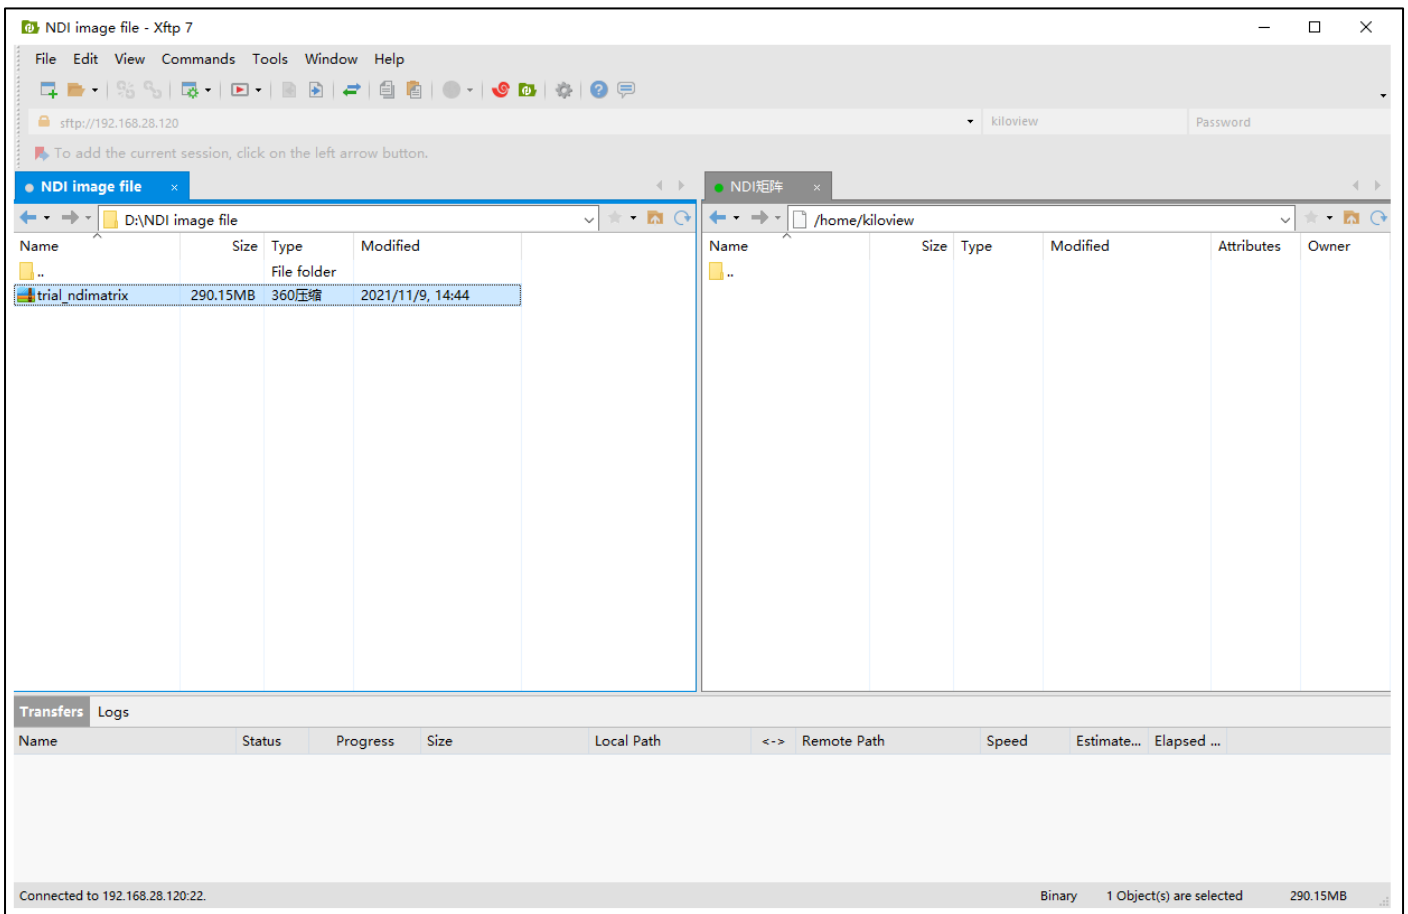

NDI Core image need to be uploaded to Liunx system from NDI local personal computer, which is required to transfer files by a file transfer tool. Deployers can use xftp files transferring tool that comes with the Xhell or other file transfer tool, such as SecureCRT.

Step 1: Click file transfer icon in the Xshell.

Step 2: Drag NDI Core image file in your computer from left window to the right window, to finish files transferring from local PC to server. (Please contact Kiloview sales or mail to info@kiloview.com with NDI Core image documents).

(2) Load NDI Core image in the server

```
docker load -i kv_ndicore_pro_011801.tar
```

Note

If the location of the NDI image file is not in the current directory, you need to specify the folder where NDI image file is located.

For example: If the directory where NDI image file is located as /home/kiloview, then the NDI image file loading command is

```
“docker load -i /home/kiloview/kv_ndicore_pro_011801.tar“
```

```
root@VM-0-9-ubuntu:/home/ubuntu# docker load -i kv_ndicore_pro_011801.tar

Loaded image: kiloview/kv_ndicore_senior_011801:latest
```

Step 4: Run container

```
docker run -d -v /root/cp_data3:/data/configs -v /etc/timezone:/etc/timezone -v
/etc/localtime:/etc/localtime -v /var/run/avahi-daemon:/var/run/avahi-daemon -v
/var/run/dbus:/var/run/dbus --restart=always --name kv_ndicore_senior_011801 --network host --
privileged=true kiloview/kv_ndicore_senior_011801:latest
```

```
3396c01c88c1: Loading layer [=====] 242.7kB/242.7kB
Loaded image: kiloview/kv_ndicore_senior_011801:latest
root@VM-0-9-ubuntu:/home/ubuntu# docker run -d -v /root/cp_data3:/data/configs -v /etc/timezone:/etc/timezone -v
/etc/localtime:/etc/localtime -v /var/run/avahi-daemon:/var/run/avahi-daemon -v /var/run/dbus:/var/run/dbus --restart=always --
name kv_ndicore_senior_011801 --network host --privileged=true kiloview/kv_ndicore_senior_011801:latest
db1924fe5313aa9201c2054877d61882633adfbef0001ac5e6642a6d6c59ba
```

Note:

The last image name in the above command (like kv_ndicore_senior_011801 in the below picture) must be the same as the name behind the loaded image at the top of the command line.

1.4 Login authentications

Enter "IP address of server:81" in the browser (Google is recommended), press enter to display the login interface of the NDI Core. The default user name and password are **admin**.

2 General Questions and Solutions

2.1 If there is an error message during the deployment process.

Solution:

Please check the version of your operation system, currently it only supports Linux64-bit operating system

(Ubuntu 18.04+ / Debian 9+)

(1) Check linux digits: `getconf LONG_BIT`

```
ubuntu@VM-4-5-ubuntu:~$ getconf LONG_BIT
64
ubuntu@VM-4-5-ubuntu:~$
```

(2) Check the version number of the linux: `cat /proc/version`

```
ubuntu@VM-4-5-ubuntu:~$ cat /proc/version
Linux version 5.4.0-77-generic (bulld@lgw01-amd64-028) (gcc version 9.3.0 (Ubuntu 9.3.0-17ubuntu1~20.04))
#86-Ubuntu SMP Thu Jun 17 02:35:03 UTC 2021
ubuntu@VM-4-5-ubuntu:~$
```

2.2 No response for a long time for the installation of the docker.

Solution:

The process of the installation is relatively slow, please wait patiently. You can use command “`docker version`” to check and confirm whether the installation is successful.

```
root@ndi:~/cp_data3# docker version
Client: Docker Engine - Community
Version:      20.10.6
API version:  1.41
Go version:   go1.13.15

root@ndi:~/# docker run -d --name status --restart=always -v /var/run/docker.sock:/var/run/docker.sock:ro --pid host --network host -e GLANCES_OPT="-w" nicolargo/glances
Unable to find image 'nicolargo/glances:latest' locally
latest: Pulling from nicolargo/glances
docker: error parsing HTTP 408 response body: invalid character '<' looking for beginning of value: "<html><body><h1>408 Request Time-out</h1>\nYour browser didn't send a complete request in time.\n</body></html>\n\n".
See 'docker run --help'.
root@ndi:~/#
```

Solution:

To pull the image, you need to get the image file by the internet. If the network delay is high or you cannot connect to the internet, kindly check whether the network is smooth by ping an external website.

2.4 NDI Core could not be logged in normally

Solution:

Check the server whether it could start normally. "win+R" to open command prompt window -> "cmd"

-> "ping server ip" .

(1) If it is able to ping the server IP, please check via below command.

<1>Check the status of running docker: `systemctl status docker`

```
root@ndi:~/cp_data3# systemctl status docker
● docker.service - Docker Application Container Engine
   Loaded: loaded (/lib/systemd/system/docker.service; enabled; vendor preset: enabled)
   Active: active (running) since Tue 2021-11-09 09:00:05 UTC; 1 day 1h ago
 TriggeredBy: ● docker.socket
   Docs: https://docs.docker.com
   Main PID: 53134 (dockerd)
    Tasks: 25
   Memory: 640.7M
   CGroup: /system.slice/docker.service
           └─53134 /usr/bin/dockerd -H fd:// -H 0.0.0.0:2375 --containerd=/run/containerd/containerd.sock
```

If docker could not start normally, start docker: `systemctl start docker`

<2>Check the status of running container: `docker ps -a`

```
root@ndi:~/cp_data3# docker ps -a
CONTAINER ID   IMAGE                                COMMAND                  CREATED        STATUS        PORTS        NAMES
563282ea0ee8   kiloview/trial_ndimatrix:latest     "/start_server.sh"      24 hours ago  Up 24 hours                trial_ndimatrix
2594ce003d0d   nicolargo/glances                   "/bin/sh -c 'python3..." 24 hours ago  Up 24 hours                status
root@ndi:~/cp_data3#
```

If container runs abnormally, execute below command to delete container and image, then redeploy as deployment guide.

Stop all containers: `docker stop $(docker ps -aq)`

Delete all containers: `docker rm $(docker ps -aq)`

Delete all images: `docker rmi $(docker images -q)`

(2) If it is unable to ping the server IP, please check as below instruction.

<1> Check whether maintenance PC and server run normally or not and whether LAN port light flashes normally or not.

<2> The server IP maybe already changed, directly connect server "win+R" -> "cmd" -> "ifconfig" , and apply changed IP address: 81 to visit.

2.5 How to set static IP address for NDI Core

Solution:

The ways of setting static IP address may be different as different operation system. Configuration ways in below applies to ubuntu 20.04 version.

```
sudo vi /etc/netplan/00-installer-config.yaml
```

Note:

- (1) The Internet configuration file name for different minor versions may be different, as "00-installer-config.yaml" files name is different, enter netplan file via `cd /etc/netplan`, search Internet configuration file, enter corresponding Internet configuration files by `vi` command.
 - (2) Press "i" to access the file editing mode.
 - (3) After inputting, enter "ESC" , and then enter " :wq " , save the file and exit.
-

- (4) If you make a mistake input and don't want to save the file, press "ESC" and input ":q!" , exit without saving files.

```
# This is the network config written by 'subiquity'
network:

      gateway4: 192.168.2.1
  version: 2
```

2.6 It shows "no such file or directory" error during command execution.

```
root@1:~# docker run -d -v /home/data:/data/configs -v /var/run/avahi-daemon:/var/run/avahi-daemon -v /var/run/dbus:/var/run/dbus --restart=always --name kv_ndimatrix --network host --privileged=true kiloview/trial_ndimatrix:latest
-bash: docker run -d -v /home/data:/data/configs -v /var/run/avahi-daemon:/var/run/avahi-daemon -v /var/run/dbus:/var/run/dbus --restart=always --name kv_ndimatrix: No such file or directory
root@1:~# ls
snap
```

Solution:

When you copy the command from the file, it may include the form character and cause the command to change. When you encounter this, please execute the command manually.
